

Lipocine Announces Completion of Enrollment and Dosing in Phase 3 Trial of LPCN 1154 in Postpartum Depression (PPD)

SALT LAKE CITY, Jan. 20, 2026 /PRNewswire/ -- Lipocine Inc. (NASDAQ: LPCN), a biopharmaceutical company leveraging its proprietary technology platform to develop innovative products with effective oral delivery, today announced that enrollment and participant dosing have been completed in its Phase 3 clinical trial evaluating LPCN 1154 (oral brexanolone) for the treatment of postpartum depression (PPD).

A total of 90 patients were randomized in the study. To date, LPCN 1154 has demonstrated a favorable safety profile, with no reports of drug discontinuations, excessive sedation, loss of consciousness, or drug-related serious adverse events (SAEs).

"We look forward to reporting topline safety and efficacy results early in the second quarter of 2026." said Mahesh Patel, CEO of Lipocine.

About the Phase 3 Study

The pivotal, randomized, double-blind study is evaluating LPCN 1154 compared to placebo in women aged 15 years and older diagnosed with severe PPD. Following constructive feedback from the U.S. Food and Drug Administration (FDA), the trial is being conducted entirely in an outpatient setting and administration of LPCN 1154 does not require medical monitoring by a healthcare provider. Data from this Phase 3 trial are expected to support a 505(b)(2) NDA submission for LPCN 1154 in 2026. For more information, refer to clinicaltrials.gov: NCT06979544.

About LPCN 1154

LPCN 1154 is an oral formulation of brexanolone being developed to provide rapid relief of postpartum depression in a convenient, at-home treatment. It has potential as first line treatment choice for women with PPD. It also has characteristics that could be particularly beneficial to patients with severe PPD (including those with elevated suicide risk) for whom rapid improvement is a priority.

About Postpartum Depression and Unmet Needs

PPD is a major depressive disorder with onset either during pregnancy or within four weeks of delivery, with symptoms persisting up to 12 months after childbirth. Hormonal changes leading to GABA dysfunction are common in depression and pregnancy. Symptoms of PPD include hallmarks of major depression, including, but not limited to, sadness, depressed mood, loss of interest, change in appetite, insomnia, sleeping too much, fatigue, difficulty thinking/concentrating, excessive crying, fear of harming the baby/oneself, and/or thoughts of death or suicide. Results from a recent survey (Truist Securities Research, January 2024) show that obstetricians believe approximately 20-40% of their patients may suffer from PPD. Further, obstetricians are comfortable making a diagnosis and prescribing antidepressants for PPD. Current treatment options remain limited by delayed onset and tolerability concerns. Traditional antidepressants, not approved for PPD, have slow onset of action, side effects such as weight gain, and do not demonstrate adequate remission.

About Lipocine

Lipocine is a biopharmaceutical company leveraging its proprietary technology platform to develop innovative products with effective oral delivery. Lipocine has drug candidates in development as well as drug candidates for which we are exploring partnerships. Our drug candidates represent enablement of differentiated patient friendly oral delivery options for favorable benefit to risk profile which target large addressable markets with significant unmet medical needs.

Lipocine's development pipeline includes: LPCN 1154 for the treatment of postpartum depression, LPCN 2201 for major depressive disorder, LPCN 2202 for treatment resistant depression, LPCN 2101 for the treatment of epilepsy, LPCN 2203 targeted for the management of essential tremor, LPCN 2401 as an aid for improved body composition in obesity management, LPCN 1148 targeted for the management of symptoms associated with liver cirrhosis, and LPCN 1107 our candidate for prevention of preterm birth. TLANDO, a novel oral prodrug of testosterone containing testosterone undecanoate developed by Lipocine, is approved by the FDA for conditions associated with a deficiency of endogenous testosterone, also known as hypogonadism, in adult males.
